# Chapter 1

# Getting Started

## Getting Started

## The GDC Application Programming Interface (API): An Overview

The GDC API drives the GDC Data and Submission Portals and provides programmatic access to GDC functionality. This includes searching for, downloading, and submitting data and metadata. The GDC API uses JSON as its communication format, and standard HTTP methods like GET, PUT, POST and DELETE.

This guide explains how to construct and execute API requests and interpret API responses.

## Tools for communicating with the GDC API

Many third-party tools can be used for communicating with the GDC API and for preparing and visualizing API calls. Examples of tools for communicating with the GDC API:

Tool	Туре
Curl	Command line tool
HTTPie	Command line tool
Postman REST Client	App for Google Chrome and OS X
DHC REST Client	Google Chrome extension
Google Chrome	Google Chrome web browser

#### Examples of tools that can help build GDC API calls:

Tool	Description
JSONLint	Validate JSON
JSON Formatter	Format, validate, and convert JSON to other formats
Percent-(URL)-encoding tool	Tool for percent-encoding strings
JSON escape tool	Tool for escaping strings using JSON string rules

## **API Endpoints**

Communicating with the GDC API involves making calls to API endpoints. Each GDC API endpoint represents specific API functionality, as summarized in the following table:

Endpoint	Type	Description
status	Status	Get the API status and version information
projects	Search & Retrieval	Search all data generated by a project
cases	Search & Retrieval	Find all files related to a specific case, or sample donor.
files	Search & Retrieval	Find all files with specific characteristics such as file_name, md5sum, data_format and others.
annotations	Search & Retrieval	Search annotations added to data after curation
data	Download	Used to download GDC data
manifest	Download	Generates manifests for use with GDC Data Transfer Tool
slicing	BAM Slicing	Allows remote slicing of BAM format objects
submission	Submission	Returns the available resources at the top level above programs i.e., registered programs

The HTTP URL that corresponds to the latest version of a GDC API endpoint is https://api.gdc.cancer.gov/<endpoint>, where <endpoint> is the name of the endpoint.

where <endpoint> is the name of the endpoint and <version> is the GDC API version.

The HTTP URL of an endpoint corresponding to a specific major version of the GDC API is https://api.gdc.cancer.gov/<version>/<

For example, the address of the latest version of the status endpoint is https://api.gdc.cancer.gov/status, whereas the address of the status endpoint corresponding to version 0 of GDC API is https://api.gdc.cancer.gov/v0/status.

#### GDC Legacy Archive

To interact with data in the GDC Legacy Archive, add legacy to the endpoint URL:

1 https://api.gdc.cancer.gov/<version>/legacy/<endpoint>

## Entity UUIDs

All objects (*entities*) in the GDC are assigned a unique identifier in the form of a version 4 universally unique identifier (UUID). The UUID uniquely identifies the entity in the GDC, and is stored in the entity's id property.

UUIDs are frequently used in GDC API requests and responses to identify specific entities like files, cases, and samples.

See GDC Data Model for details.

## Sample Request

The following is an example of a request to the files endpoint, which retrieves information about a BAM file stored in the GDC.

1 curl https://api.gdc.cancer.gov/files/d853e541-f16a-4345-9f00-88e03c2dc0bc?pretty=true

 $file\_endpt = 'https://api.gdc.cancer.gov/files/' file\_uuid = 'd853e541-f16a-4345-9f00-88e03c2dc0bc' response = requests.get(file endpt + file uuid) print json.dumps(response.json(), indent=2)$ 

<sup>&</sup>quot;' python import requests import json

```
1 {
    "data": {
2
       "data_type": "Aligned Reads",
3
       "updated_datetime": "2016-05-26T17:06:40.003624-05:00",
       "created_datetime": "2016-05-26T17:06:40.003624-05:00",

       "file_state": "processed"
20
21
       "experimental_strategy": "WXS"
    },
22
    "warnings": {}
23
24 }
```

#### Authentication

Authentication is required for downloading controlled-access data, and for all data submission functionality. The GDC API uses tokens for authentication.

Users can obtain authentication tokens from the GDC Data Portal and the GDC Data Submission Portal. See the GDC Data Portal User's Guide and the GDC Data Submission Portal User's Guide for instructions.

#### Using Authentication Tokens

All API requests that require authentication must include a token as an X-Auth-Token custom HTTP header.

In the following example, an authentication token is saved as an environment variable and passed to curl to download a controlled-access file:

```
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl -O -J -H "X-Auth-Token: $token"
     https://api.gdc.cancer.gov/data/a1c1b23b-cc41-4e85-b1b7-62a42873c5af'
   % Total
               % Received % Xferd Average Speed
                                                   Time
                                                           Time
                                                                    Time Current
                                   Dload
                                         Upload
                                                   Total
                                                           Spent
                                                                    Left Speed
3 100 31.4M 100 31.4M
                                                          0:01:50 --:-- 172k
                                0
                                    290k
                                              0
                                                 0:01:50
4 curl: Saved to filename
     'ACOLD_p_TCGA_Batch17_SNP_N_GenomeWideSNP_6_A03_466078.tangent.copynumber.data.txt'
```

For more information about authentication tokens, including token expiration and rotation, see Data Security.

**NOTE:** The authentication token should be kept in a secure location, as it allows access to all data accessible by the associated user account.

## Chapter 2

## Search and Retrieval

#### Search and Retrieval

### **Introducing Search and Retrieval Requests**

The GDC API provides endpoints that search and retrieve information stored in the GDC according to the GDC Data Model. The general format of requests to search & retrieval endpoints is described below.

**Note:** Queries described in this section work for datasets that have been released to the GDC Data Portal. Unreleased data that is in the process of being submitted to GDC cannot be queried using these methods. See Submission to learn how to query unreleased data using GraphQL.

#### Components of a Request

A typical search and retrieval API request specifies the following parameters:

- a filters parameter, that specifies the search terms for the query
- several parameters that specify the API response, such as:
  - format specifies response format (JSON, TSV, XML)
  - fields specifies the which data elements should be returned in the response, if available
  - size specifies the the maximum number of results to include in the response
  - other parameters are described below.

Requests can be executed using HTTP GET or HTTP POST. GET requests are limited by maximum URL length, so the POST method is recommended for large queries.

Note: Requests for information stored in the GDC Legacy Archive must be directed to legacy/ endpoints. See Getting Started for details.

#### **POST Example**

The following is an example of an HTTP POST request to the files endpoint of the GDC API. It looks for Gene Expression Quantification files associated with specific TCGA cases (represented by TCGA barcodes) and retrieves the associated biospecimen metadata in TSV format.

#### Request

```
1 curl --request POST --header "Content-Type: application/json" --data @Payload
    'https://api.gdc.cancer.gov/files' > response.tsv
```

#### Payload

```
1 {
       "filters":{
2
3
           "op": "and",
           "content":[
                {
                    "op":"in",
                    "content":{
                         "field": "cases.submitter_id",
                         "value":[
                             "TCGA-CK-4948",
10
                             "TCGA-D1-A17N",
11
                             "TCGA-4V-A9QX",
12
                             "TCGA-4V-A9QM"
13
                        ]
14
                    }
15
16
                },
17
                    "op":"=",
18
                    "content":{
19
                         "field": "files.data_type",
20
                         "value": "Gene Expression Quantification"
21
                    }
22
                }
23
           ]
^{24}
25
       },
       "format": "tsv",
26
       "fields": "file_id,file_name,cases.submitter_id,cases.case_id,data_category,data_type,cases.samples.tumor_des
27
       "size":"1000"
28
29 }
```

Each component of the request is explained below.

#### **GET Example**

The above request can be executed as an HTTP GET:

Each component of the request is explained below.

## **Endpoints**

The following search and retrieval endpoints are available in the GDC API:

Endpoints	Description
files	Information about files stored in the GDC
cases	Information related to cases, or sample donors.
projects	Information about projects

Endpoints	Description
annotations	Information about annotations to GDC data
_mapping	Information about elements that can be used to query other endpoints

The choice of endpoint determines what is listed in the search results. The files endpoint will generate a list of files, whereas the cases endpoint will generate a list of cases. Each of the above endpoints, other than \_mapping, can query and return any of the related fields in the GDC Data Model. So the cases endpoint can be queried for file fields (e.g. to look for cases that have certain types of experimental data), and the files endpoint can be queried for clinical metadata associated with a case (e.g. to look for files from cases diagnosed with a specific cancer type).

#### Project Endpoint

The projects endpoint provides access to project records, the highest level of data organization in the GDC.

#### Example

This example is a query for projects contained in the GDC. It uses the from, size, sort, and pretty parameters, and returns the first two projects sorted by project id.

1 curl 'https://api.gdc.cancer.gov/projects?from=0&size=2&sort=project.project\_id:asc&pretty=true'

```
1 {
     "data": {
2
       "hits": [
3
4
           "dbgap_accession_number": null,
5
           "disease_type": [
6
             "Brain Lower Grade Glioma"
           ],
           "released": true,
           "state": "legacy",
10
           "primary_site": [
11
             "Brain"
12
           ],
13
           "project_id": "TCGA-LGG",
14
           "id": "TCGA-LGG",
15
           "name": "Brain Lower Grade Glioma"
16
         },
17
18
           "dbgap_accession_number": null,
19
20
           "disease type": [
21
             "Thyroid Carcinoma"
22
           ],
           "released": true,
23
           "state": "legacy",
24
           "primary_site": [
25
26
              "Thyroid"
27
           "project_id": "TCGA-THCA",
28
           "id": "TCGA-THCA",
29
           "name": "Thyroid Carcinoma"
30
         }
31
       ],
32
33
       "pagination": {
```

```
34
         "count": 2,
         "sort": "project.project_id:asc",
35
36
         "from": 0,
         "page": 1,
37
38
         "total": 39,

         "size": 2
40
41
42
    },
43
     "warnings": {}
44 }
```

#### Retrieval of project metadata using project\_id

The project endpoint supports a simple query format that retrieves the metadata of a single project using its project\_id:

1 curl
 'https://api.gdc.cancer.gov/projects/TARGET-NBL?expand=summary.summary.experimental\_strategies,summary.data\_

```
1 {
     "data": {
       "dbgap_accession_number": "phs000467",
3
       "disease_type": [
4
         "Neuroblastoma"
5
       ],
6
       "summary": {
7
         "data_categories": [
8
9
10
              "case_count": 151,
             "file_count": 471,
11
12
             "data_category": "Transcriptome Profiling"
           },
13
14
             "case_count": 1127,
15
             "file_count": 3,
16
              "data_category": "Biospecimen"
17
           },
18
           {
19
              "case_count": 216,
20
             "file_count": 1732,
21
             "data_category": "Simple Nucleotide Variation"
22
           },
23
           {

#### Files Endpoint

The GDC Files Endpoint https://api.gdc.cancer.gov/files enables search and retrieval of information relating to files stored in the GDC, including file properties such as file\_name, md5sum, data\_format, and others.

#### Example

This example is a query for files contained in the GDC. It uses the from, size, sort, and pretty parameters, and returns only the first two files, sorted by file size, from smallest to largest.

1 curl 'https://api.gdc.cancer.gov/files?from=0&size=2&sort=file\_size:asc&pretty=true'

```
1 {
    "data": {
2
       "hits": [
3
         {
4
           "data_type": "Raw Simple Somatic Mutation",
5
           "updated_datetime": "2017-03-04T16:45:40.925270-06:00",
6
           "file_name": "9f78a291-2d50-472c-8f56-5f8fbd09ab2a.snp.Somatic.hc.vcf.gz",

#### Retrieval of file metadata using individual UUIDs:

The files endpoint supports a simple query format that retrieves the metadata of a single file using its UUID:

1 curl 'https://api.gdc.cancer.gov/files/000225ad-497b-4a8c-967e-a72159c9b3c9?pretty=true'

```
1 {
 2
    "data": {
 3
       "data_type": "Raw Simple Somatic Mutation",
       "updated_datetime": "2016-06-04T23:42:25.428738-05:00",
4
       "created_datetime": "2016-06-03T19:04:32.950673-05:00",
5
6
       "file_name": "000225ad-497b-4a8c-967e-a72159c9b3c9.snp.Somatic.hc.vcf.gz",
       "md5sum": "bbe8a7157acbfc9133e47898650b5437",
       "data_format": "VCF",
8
       "acl": [
9
         "phs000178"
10
       ],
11
       "access": "controlled",
12
13
       "state": "submitted",
```

```
14
      "file id": "000225ad-497b-4a8c-967e-a72159c9b3c9",
      "data_category": "Simple Nucleotide Variation",
15
       "file_size": 19690,
16
       "submitter_id": "TCGA-VR-A8ET-01A-11D-A403-09_TCGA-VR-A8ET-10B-01D-A403-09_varscan",
17
       "type": "simple_somatic_mutation",
18
      "file_state": "processed",
19
       "experimental_strategy": "WXS"
20
    },
21
     "warnings": {}
22
23 }
```

Note: The file\_size field associated with each file is reported in bytes.

#### Cases Endpoint

The GDC Cases Endpoint https://api.gdc.cancer.gov/cases enables search and retrieval of information related to a specific case.

**Note:** The cases endpoint is designed to retrieve the metadata associated with one or more cases, including all nested biospecimen entities. Filters can be applied to retrieve information for entire cases, but not for lower-level biospecimen entities. For example, a sample within a case cannot be used to query for aliquots that are associated only with that sample. All aliquots associated with the case would be retrieved.

#### Example

This example is a query for files contained in GDC. It returns case where submitter id is TCGA-BH-AOEA, using the pretty and filters parameters and the following filtering operators:

```
1 {"op":"and","content":[{"op":"in","content":{"field":"submitter_id","value":["TCGA-BH-AOEA"]}}]}
```

Command:

1 curl

'https://api.gdc.cancer.gov/cases?filters=%7B%22op%22%3A%22and%22%2C%22content%22%3A%5B%7B%22op%22%3A%22in%2

```

#### **Annotations Endpoint**

The GDC Annotation Endpoint https://api.gdc.cancer.gov/annotations enables search and retrieval of annotations stored in the GDC.

#### Example

This example is a query for any annotations **directly** associated with the following GDC entities:

- $\bullet \ \ {\rm the \ case \ with \ UUID \ e0d36cc0-652c-4224-bb10-09d15c7bd8f1}$
- $\bullet$  the sample with UUID 25ebc29a-7598-4ae4-ba7f-618d448882cc
- $\bullet$  the aliquot with UUID fe660d7c-2746-4b50-ab93-b2ed99960553

The query uses the filters parameter to specify entity UUIDs. Code samples below include the bare and percent-encoded filter JSON.

```
10 }
11 }
```

1 %7B%22op%22%3A%22in%22%2C%22content%22%3A%7B%22field%22%3A%22entity\_id%22%2C%22value%22%3A%5B%22e0d36cc0-652c-42

```
1 curl
```

https://api.gdc.cancer.gov/annotations?filters=%7B%22op%22%3A%22in%22%2C%22content%22%3A%7B%22field%22%3A%2

```

#### \_mapping Endpoint

Each search and retrieval endpoint is equipped with a \_mapping endpoint that provides information about available fields. For example, files/\_mapping endpoint provides information about fields and field groups available at the files endpoint: https://api.gdc.cancer.gov/files/\_mapping.

The high-level structure of a response to a \_mapping query is as follows:

```
1 "_mapping": {}
2 , "defaults": []
3 , "expand": []
4 , "fields": []
5 , "multi": []
6 , "nested": []
```

Each part of the response is described below:

Part	Description		
_mapping	All available fields and their descriptions. The endpoint-agnostic field names provided here are comp with the filters parameter but are not always compatible with the fields parameter		
defaults	The default set of fields included in the API response when the fields parameter is not used in the reques		
expand	Field group names for use with the expand parameter		
fields	All available fields in an endpoint-specific format that is compatible with both the filters and fields parameters		
multi	GDC internal use		
nested	Nested fields		

#### Example

```
1 curl 'https://api.gdc.cancer.gov/projects/_mapping'
1 {
2   ...
3
```

```
"_mapping": {
4
           "projects.disease_type": {
5
             "doc_type": "projects",
6
              "field": "disease_type",
              "type": "id"
           },
           "projects.name": {
10
              "doc_type": "projects",
11
             "field": "name",
12
             "type": "id"
13
           }
14
         }
15
16
17
18
19 }
```

Similar information can be obtained using the fields parameter; fields queries provide additional information in the response, such as the name of the Elastic Search document (doc\_type), the field name and the type of value. A list of supported types (such as string, long, float, ...) can be obtained from Elastic Search Documentation.

### Request Parameters

The GDC API supports the following search & retrieval request parameters:

Parameter	Default	Description	
filters	null	Specifies search parameters	
format	JSON	Specifies the API response format: JSON, XML, or TSV	
pretty	false	Returns response with indentations and line breaks in a human-readable format	
fields	null	Specifies which fields to include in the response	
expand	null	Returns multiple related fields	
size	10	Specifies the number of results to return	
from	0	Specifies the first record to return from a set of search results	
sort	null	Specifies sorting for the search results	
facets	null	Provides all existing values for a given field and the number of records having this value.	

#### Filters: Specifying the Query

The filters parameter enables passing of complex search queries to the GDC API. The parameter carries a query in the form of a JSON object.

#### **Query Format**

A filters query consists of an operator (or a nested set of operators) with a set of field and value operands.

The following filters query operators are supported by the GDC API:

Operator	Description	Number of Operands	Logic example
=	equals (string or number)	one	gender = "female"

Operator	Description	Number of Operands	Logic example
!=	does not equal (string or number)	one	project_id != "TARGET-AML"
<	less than (number)	one	age at diagnosis $< 90y$
<=	less than or equal (number)	one	age at diagnosis $\leq 17$
	greater than (number)	one	age at diagnosis $> 50$
	greater than or equal (number)	one	age at diagnosis $>= 18$
=			
is	is (missing)	one	gender is missing
not	not (missing)	one	race not missing
in	matches a string or number in (a list)	multiple	primary_site in [Brain, Lung]
exclude	does not match any strings or values in (a list)	multiple	experimental_strategy exclude [WXS, WGS, "Genotyping array"]
and	(operation1) and (operation2)	multiple	{primary_site in [Brain, Lung]} and {gender = "female"}
or	(operation1) or (operation2)	multiple	{project_id != "TARGET-AML"} or {age at diagnosis $< 90y$ }

The field operand specifies a field that corresponds to a property defined in the GDC Data Dictionary. A list of supported fields is provided in Appendix A; the list can also be accessed programmatically at the \_mapping endpoint.

The value operand specifies the search terms. Users can get a list of available values for a specific property by making a call to the appropriate API endpoint using the facets parameter, e.g. https://api.gdc.cancer.gov/v0/cases?facets=demographic.gender&sizeSee Facets for details.

A simple query with a single operator looks like this:

A more complex query with multiple operators looks like this:

```
1 {
       "op": "and",
2
       "content":[
3
4
                "op":"in",
                "content":{
6
                    "field":"cases.submitter_id",
                    "value":[
                         "TCGA-CK-4948",
9
                         "TCGA-D1-A17N",
10
                         "TCGA-4V-A9QX",
11
                         "TCGA-4V-A9QM"
12
13
                }
14
15
           },
```

```
16
                "op":"=",
17
                "content":{
18
                     "field":"files.data_type",
19
20
                     "value": "Gene Expression Quantification"
                }
21
           }
22
23
       ]
24 }
```

#### **Example: HTTP GET Request**

This example requests male cases using HTTP GET.

The JSON object to be passed to the GDC API looks like:

URL-encoding the above JSON object using Percent-(URL)-encoding tool results in the following string:

 $1\ \%7b\%22op\%22\%3a+\%22\%3d\%22\%2c\%0d\%0a++++++\%22content\%22\%3a+\%7b\%0d\%0a+++++++++++\%22field\%22\%3a+\%22cases.clinical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderical.genderi$ 

The above string can now be passed to the GDC API using the filters parameter:

```
1 curl 'https://api.gdc.cancer.gov/cases?filters=%7b%22op%22%3a+%22%3d%22%2c%0d%0a++++++%22content%22%3a+%7b%0d%0a
```

### Example: HTTP POST Request

This example demonstrates how to obtain metadata in TSV format for a set of files using their UUIDs (e.g. UUIDs obtained from a download manifest file generated by the GDC Data Portal).

The first step is to construct a JSON query object, including filters, fields, format, and size parameters. The object is then submitted as HTTP POST payload to the GDC API using curl, in order to retrieve a TSV file with the requested metadata.

       <warnings/>
```

### **Pretty**

32 </response>

1 import requests

Returns when the pretty parameter is set to true, the API response is formatted with additional whitespace to improve legibility.

### Example

1 curl 'https://api.gdc.cancer.gov/cases?fields=submitter\_id&sort=submitter\_id:asc&size=5&pretty=true'

```
1 {
     "data": {
2
       "hits": [

#### **Fields**

This query parameter specifies which fields are to be included in the API response. The fields in the API response will be unordered. A listing of available fields for each endpoint is provided in Appendix A.

### Example

The following example requests case submitter ID, file UUID, file name and file size from the files endpoint.

1 curl 'https://api.gdc.cancer.gov/files?fields=cases.submitter\_id,file\_id,file\_name,file\_size&pretty=true'

```
import requests
import json

files_endpt = 'https://api.gdc.cancer.gov/files'
params = {'fields':'cases.submitter_id,file_id,file_name,file_size'}
response = requests.get(files_endpt, params = params)
print json.dumps(response.json(), indent=2)
```

```

### **Expand**

The expand parameter provides a shortcut to request multiple related fields (field groups) in the response. Instead of specifying each field using the fields parameter, users can specify a field group name using the expand parameter to request all fields in the group. Available field groups are listed in Appendix A; the list can also be accessed programmatically at the \_mapping endpoint. The fields and expand parameters can be used together to request custom combinations of field groups and individual fields.

### Example

1 curl 'https://api.gdc.cancer.gov/files/ac2ddebd-5e5e-4aea-a430-5a87c6d9c878?expand=cases.samples&pretty=true'

### Size and From

GDC API provides a pagination feature that limits the number of results returned by the API. It is implemented using size and from query parameters.

The size query parameter specifies the maximum number of results to return. Default size is 10. If the number of query results is greater than size, only some of the results will be returned.

The from query parameter specifies the first record to return out of the set of results. For example, if there are 20 cases returned from the cases endpoint, then setting from to 11 will return results 12 to 20. The from parameter can be used in conjunction with the size parameter to return a specific subset of results.

### Example

1 curl 'https://api.gdc.cancer.gov/files?fields=file\_name&from=0&size=2&pretty=true'

```
1 {
     "data": {

```

### Sort

19

}

The sort query parameter sorts the results by a specific field, and with the sort direction specified using the :asc (ascending) or :desc (descending) prefix, e.g. sort=field:desc. A list of all valid field names is available in Appendix A; the list can also be

accessed programmatically at the \_mapping endpoint.

### Example

Sort cases by submitter\_id in ascending order:

```
1 curl 'https://api.gdc.cancer.gov/cases?fields=submitter_id&sort=submitter_id:asc&pretty=true'
```

```
1 import requests
2 import json
4 cases_endpt = 'https://api.gdc.cancer.gov/cases'
5 params = {'fields':'submitter_id',
             'sort':'submitter_id:asc'}
7 response = requests.get(cases_endpt, params = params)
8 print json.dumps(response.json(), indent=2)
1 {
     "data": {

56 }
```

#### **Facets**

The facets parameter provides aggregate information for a specified field. It provides all values that exist for that field, and the number of entities (cases, projects, files, or annotations) that this value. The primary intended use of this parameter is for displaying aggregate information in the GDC Data Portal.

The facets parameter can be used in conjunction with the filters parameter to get aggregate information for a set of search results. The following limitations apply when using facets and filters together:

- 1. The filters object's top level operator must be and, and the internal filters must be limited to: =, !=, in, exclude, is, and not.
- 2. The information provided by facets for a given field will disregard any filters applied to that same field.

#### Example

1 import requests

11

This is an example of a request for a count of projects in each program.

```
1 curl
    'https://api.gdc.cancer.gov/projects?facets=program.name&from=0&size=0&sort=program.name:asc&pretty=true'
```

```
2 import json
4 projects_endpt = 'https://api.gdc.cancer.gov/projects'
5 params = {'facets':'program.name',
             'from':0, 'size':0,
6
             'sort':'program.name:asc'}
8 response = requests.get(projects_endpt, params = params)
9 print json.dumps(response.json(), indent=2)
1 {
    "data": {
2
3
       "pagination": {
4
         "count": 0,
         "sort": "program.name:asc",
5
6
         "from": 0,
         "page": 1,
7
         "total": 39,
8
9
         "pages": 39,
         "size": 0
10
```

```
"hits": [],
12
       "aggregations": {
13
          "program.name": {
14
            "buckets": [
15
16
              {
                "key": "TCGA",
17
                "doc_count": 33
18
              },
19
20
                "key": "TARGET",
21
                "doc_count": 6
22
              }
23
24
           ]
25
         }
       }
26
     },
27
     "warnings": {}
28
29 }
```

### Example

In this sample POST request, both filters and facets parameters are used. Note that facets ignores the primary\_site filter.

```
1 {
       "filters":{
2
            "op": "and",
3
            "content":[
4
                {
5
                     "op":"=",
6
                     "content":{
7
                         "field":"cases.project.primary_site",
8
                         "value": "Kidney"
9
                    }
10
                },
11
12
                     "op":"=",
13
                     "content":{
14
15
                         "field": "project.program.name",
                         "value": "TCGA"
16
17
                }
18
19
           ]
       },
20
21
       "size":"0",
       "facets": "project.primary_site",
22
       "pretty":"true"
23
24 }
```

```
1 {
2  "data": {
3     "pagination": {
4         "count": 0,
5         "sort": "",

              }
119
            ]
120
121
122
```

```
123 },
124 "warnings": {}
125 }
```

### Alternative Request Format

The GDC API also supports POST requests with Content-Type: application/x-www-form-urlencoded (curl default), which require payloads in the following format:

filters=%7B%0A%20%20%20%22op%22%3A%22in%22%2C%0A%20%20%20%20%22content%22%3A%7B%0A%20%20%20%20%20%20%20%20%20%

## Using Wildcards

The GDC API supports the use of the wildcard character, an asterisk (\*), in the value fields of a JSON query. For example, if a user wanted to retrieve information about projects with a disease type that ended in "Adenocarcinoma" a query for "disease\_type": "\*Adenocarcinoma" would be appropriate. See below:

```
1 {
      "size": "20000",
      "pretty": "TRUE",
3
4
      "fields": "submitter_id, disease_type",
      "format": "TSV",
      "filters":{
6
         "op":"=",
7
         "content":{
             "field": "disease_type",
             "value": "*Adenocarcinoma"
10
         }
11
      }
12
13 }
```

# Quicksearch Endpoint

The GDC Portal has a quicksearch functionality that allows for a project, case, or file to be queried from a search box. This function calls the /v0/all endpoint, which retrieves the top cases, files, and projects that match to the query. The quicksearch can also be used programmatically through the API. For example, a search term of 'TCGA' would produce the following query:

1 curl "https://api.gdc.cancer.gov/v0/all?query=TCGA&size=5"

```
1 {
     "data": {
2
3
       "query": {
         "hits": [
5
             "disease_type": [
               "Esophageal Carcinoma"
             "id": "UHJvamVjdDpUQ0dBLUVTQ0E=",
             "name": "Esophageal Carcinoma",
10
             "primary_site": [
11
               "Esophagus"
12
13
             "project_id": "TCGA-ESCA"
14
```

```
15
           },
           {
16
              "disease_type": [
17
                "Head and Neck Squamous Cell Carcinoma"
18
             ],
19
             "id": "UHJvamVjdDpUQOdBLUhOUOM=",
20
              "name": "Head and Neck Squamous Cell Carcinoma",
21
22
              "primary_site": [
                "Head and Neck"
23
^{24}
             ],
              "project_id": "TCGA-HNSC"
25
           },
26
           {
27
              "disease_type": [
28
                "Liver Hepatocellular Carcinoma"
29
30
             "id": "UHJvamVjdDpUQOdBLUxJSEM=",
31
              "name": "Liver Hepatocellular Carcinoma",
32
              "primary_site": [
33
                "Liver"
34
35
             ],
             "project_id": "TCGA-LIHC"
36
           },
37
           {
38
              "disease_type": [
39
                "Colon Adenocarcinoma"
40
41
             "id": "UHJvamVjdDpUQOdBLUNPQUQ=",
42
             "name": "Colon Adenocarcinoma",
43
              "primary_site": [
44
                "Colorectal"
45
             ],
46
             "project_id": "TCGA-COAD"
47
           },
48
           {
49
              "disease_type": [
50
51
                "Adrenocortical Carcinoma"
             ],
52
             "id": "UHJvamVjdDpUQOdBLUFDQw==",
53
              "name": "Adrenocortical Carcinoma",
54
              "primary_site": [
55
56
                "Adrenal Gland"
57
              "project_id": "TCGA-ACC"
58
           }
59
         ]
60
       }
61
62
63 }
```

This endpoint can be used to quickly retrieve information about a file. For example, if a user wanted to know the UUID for nationwidechildrens.org\_biospecimen.TCGA-EL-A4K1.xml, the following query could be used to quickly retrieve it programmatically:

1 curl "https://api.gdc.cancer.gov/v0/all?query=nationwidechildrens.org\_biospecimen.TCGA-EL-A4K1.xml&size=5"

```
1 {
2  "data": {
3  "query": {
```

```
"hits": [
4
5
           {
6
             "file_id": "2a7a354b-e497-4ae6-8a85-a170951596c1",
             "file_name": "nationwidechildrens.org_biospecimen.TCGA-EL-A4K1.xml",
             "id": "RmlsZToyYTdhMzUOYi11NDk3LTRhZTYtOGE4NS1hMTcwOTUxNTk2YzE=",
             "submitter_id": null
10
        ]
11
      }
12
    }
13
14 }
```

# **Additional Examples**

More examples of API functionality described in this section are provided in Additional Examples.

# Chapter 3

# Downloading Files

### Downloading Files

The GDC API implements file download functionality using data and manifest endpoints. The data endpoint allows users to download files stored in the GDC by specifying file UUID(s). The manifest endpoint generates a download manifest file that can be used with the GDC Data Transfer Tool to transfer large volumes of data.

Note: Downloading controlled access data requires the use of an authentication token. See Getting Started: Authentication for details.

Note: Requests to download data from the GDC Legacy Archive must be directed to legacy/data. See Getting Started: Legacy Archive for details.

# Data endpoint

To download a file, users can pass UUID(s) to the data endpoint. If a single UUID is provided, the API will return the associated file. If a comma-separated list of UUIDs is provided, the API will return an archive file containing the requested files.

The data endpoint supports GET and POST requests as demonstrated in the following examples.

### Related Files

If the related\_files=true parameter is specified, the following related files, if available, will be included in the download package by the GDC API:

- BAM index files (BAI files)
- Metadata files (such as SRA XML or MAGE-TAB files)

For example, this request will download a legacy copy number segmentation file and its associated MAGE-TAB metadata file:

1 https://api.gdc.cancer.gov/legacy/data/7efc039a-fde3-4bc1-9433-2fc6b5e3ffa5?related\_files=true

### Downloading a Single File using GET

This example demonstrates downloading a single file from the GDC. Here we pass the file's UUID to the data endpoint with a GET request.

```
% Total
              % Received % Xferd Average Speed
                                                   Time

### Downloading Multiple Files using GET

1 curl --remote-name --remote-header-name

This example demonstrates downloading multiple files from the GDC using a GET request. The GDC API returns a .tar.gz archive containing the downloaded files.

```

4 curl: Saved to filename 'gdc_download_064d1aa8cc8cbab33e93979bebbf7d6af2d6a802.tar.gz'
```

**Note:** This method supports downloading a limited number of files at one time. To download a large number of files, please use POST.

### Downloading an Uncompressed Group of Files

If the ?tarfile parameter is specified to a data endpoint download query all files requested in the download string will be bundled in a single tar file rather than a tar.gz file which is the default behavior.

### Downloading Multiple Files using POST

The following two examples demonstrate downloading multiple files from the GDC using a POST request that contains a payload in one of two formats: percent-encoded form data or JSON. The GDC API returns a .tar.gz archive containing the downloaded files.

As noted above, both the data and legacy/data endpoints accept POST requests.

### POST request with form data payload

POST requests that carry a payload of percent-encoded form data must include the HTTP header Content-Type: application/x-www-form-urlencoded.

The payload is a string in the following format:

```
1 ids=UUID1&ids=UUID2&ids=UUID3...
```

where UUID corresponds to the UUIDs of the files to be downloaded.

4 curl: Saved to filename 'gdc\_download\_20160701\_011153.tar.gz'

In this example we use curl to download a set of files from the GDC Legacy Archive. The payload is stored in a plain text file named Payload; curl includes the Content-Type: application/x-www-form-urlencoded header by default.

1 ids=556e5e3f-0ab9-4b6c-aa62-c42f6a6cf20c&ids=e0de63e2-02f3-4309-9b24-69f4c24e85fc&ids=f1a06178-2ec2-4b06-83f3-3a

```
1 curl --remote-name --remote-header-name --request POST 'https://api.gdc.cancer.gov/legacy/data' --data
     @Payload
   % Total
              \% Received \% Xferd Average Speed

```

### POST request with JSON payload

POST requests that carry a JSON payload must include the HTTP header Content-Type: application/json.

The payload is a string in the following format:

where UUID corresponds to the UUIDs of the files to be downloaded.

In this example we use curl to download a set of files from the GDC Legacy Archive; the payload is stored in a plain text file named Payload.

### Downloading Controlled-access Files

To download controlled-access files, a valid authentication token must be passed to the GDC API using the X-Auth-Token HTTP header:

```
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --remote-name --remote-header-name --header "X-Auth-Token: $token"
      'https://api.gdc.cancer.gov/data/0eccf79d-1f1e-4205-910f-8e126b08276e'
               % Received % Xferd Average Speed
   % Total
                                                            Time
                                                                     Time
                                                   Time
                                                                           Current
                                   Dload Upload
                                                    Total
                                                            Spent
                                              0 0:01:50
                                                           0:01:50 --:--
3 100 31.4M 100 31.4M
                                    290k
4 curl: Saved to filename
      'ACOLD_p_TCGA_Batch17_SNP_N_GenomeWideSNP_6_A03_466078.tangent.copynumber.data.txt'
```

### Manifest endpoint

The manifest endpoint generates a download manifest file that can be used with the GDC Data Transfer Tool. The Data Transfer Tool is recommended for transferring large volumes of data. The GDC API can also generate a download manifest from a list of results that match a Search and Retrieval query. To do this, append &return\_type=manifest to the end of the query.

### Using the manifest endpoint

1 curl --remote-name --remote-header-name

The manifest endpoint allows users to create a download manifest, which can be used with the GDC Data Transfer Tool to download a large volume of data. The manifest endpoint generates a manifest file from a comma-separated list of UUIDs.

```
https://api.gdc.cancer.gov/v0/manifest/ae9db773-78ab-48d0-972d-debe1bedd37d,3d815e6e-db97-419d-ad7f-dba4e40
              % Received % Xferd Average Speed
   % Total
                                                  Time
                                                          Time
                                                                   Time
                                                                         Current
                                  Dload Upload
                                                  Total
                                                          Spent
                                                                   Left
                                                                         Speed
3 100
       274 100
                  274
                                   1042
                                             0 --:--:-- --:--:--
4 curl: Saved to filename 'gdc_manifest_20160428_234614.txt'
```

The manifest endpoint also supports HTTP POST requests in the same format as the data endpoint; see above for details.

### Using return\_type=manifest

Alternatively, users can create a manifest by appending &return\_type=manifest to a Search and Retrieval query. In this example, we generate a download manifest for RNA-seq data files from solid tissue normal samples, that are part of the TCGA-KIRC project:

```
1 curl --remote-name --remote-header-name
     'https://api.gdc.cancer.gov/files?filters=%7B%22op%22%3A%22and%22%2C%22content%22%3A%5B%7B%22op%22%3A%22%3D%
   % Total
              % Received % Xferd Average Speed
                                                 Time
                                                        Time
                                                                 Time
                                                                       Current
                                 Dload Upload
                                                 Total
                                                        Spent
                                                                 Left Speed
                                            0 --:--: 77306

# Chapter 4

# Data Analysis

## Data Analysis

The GDC DAVE tools use the same API as the rest of the Data Portal and takes advantage of several new endpoints. Similar to the GDC Data Portal Exploration feature, the GDC data analysis endpoints allow API users to programmatically explore data in the GDC using advanced filters at a gene and mutation level. Survival analysis data is also available.

## **Endpoints**

The following data analysis endpoints are available from the GDC API:

Endpoint	Description
/genes	Allows users to access summary information about each gene using its Ensembl ID.
/ssms	Allows users to access information about each somatic mutation. For example, a ssm would represent the transition of C to T at position 52000 of chromosome 1.
/ssm_occurrences	A ssm entity as applied to a single instance (case). An example of a ssm occurrence would be that the transition of C to T at position 52000 of chromosome 1 occurred in patient TCGA-XX-XXXX.
/analysis/top_cases_counts_by_genes	Returns the number of cases with a mutation in each gene listed in the gene_ids parameter for each project. Note that this endpoint cannot be used with the format or fields parameters.
$/analysis/top\_mutated\_genes\_by\_project$	Returns a list of genes that have the most mutations within a given project.
$/analysis/top\_mutated\_cases\_by\_gene$	Generates information about the cases that are most affected by mutations in a given number of genes
/analysis/mutated_cases_count_by_project	Returns counts for the number of cases that have associated ssm data in each project. The number of affected cases can be found under "case_with_ssm": {"doc_count": \$case_count}.
/analysis/survival	Survival plots can be generated in the Data Portal for different subsets of data, based upon many query factors such as variants, disease type and projects. This endpoint can be used to programmatically retrieve the raw data to generate these plots and apply different filters to the data. (see Survival Example)

The methods for retrieving information from these endpoints are very similar to those used for the cases and files endpoints. These methods are explored in depth in the API Search and Retrieval documentation. The \_mapping parameter can also be used with each of these endpoints to generate a list of potential fields. For example:

```
https://api.gdc.cancer.gov/ssms/_mapping
```

Note: While it is not an endpoint, the observation entity is featured in the visualization section of the API. The observation entity provides information from the MAF file, such as read depth and normal genotype, that supports the validity of the associated ssm. An example is demonstrated below:

```
1 curl
```

"https://api.gdc.cancer.gov/ssms/57bb3f2e-ec05-52c2-ab02-7065b7d24849?expand=occurrence.case.observation.rea

# Genes Endpoint Examples

**Example 1:** A user would like to access information about the gene ZMPSTE24, which has an Ensembl gene ID of ENSG00000084073. This would be accomplished by appending ENSG00000084073 (gene\_id) to the genes endpoint.

```
1 curl "https://api.gdc.cancer.gov/genes/ENSG00000084073?pretty=true"
```

```
1 {
     "data": {
2
3
       "canonical_transcript_length": 3108,
       "description": "This gene encodes a member of the peptidase M48A family. The encoded protein is a
           zinc metalloproteinase involved in the two step post-translational proteolytic cleavage of
           carboxy terminal residues of farnesylated prelamin A to form mature lamin A. Mutations in this
           gene have been associated with mandibuloacral dysplasia and restrictive dermopathy. [provided by
           RefSeq, Jul 2008]",

## Simple Somatic Mutation Occurrence Endpoint Examples

**Example 1:** A user wants to determine the chromosome in case TCGA-DU-6407 that contains the greatest number of ssms. As this relates to mutations that are observed in a case, the ssm\_occurrences endpoint is used.

1 curl

"https://api.gdc.cancer.gov/ssm\_occurrences?format=tsv&fields=ssm.chromosome&size=5000&filters=%7B%0D%0A%22cd

```
1 ssm.chromosome id

### Analysis Endpoints

In addition to the ssms, ssm\_occurrences, and genes endpoints mentioned previously, several /analysis endpoints were designed to quickly retrieve specific datasets used for visualization display.

Example 1: The /analysis/top\_cases\_counts\_by\_genes endpoint gives the number of cases with a mutation in each gene listed in the gene\_ids parameter for each project. Note that this endpoint cannot be used with the format or fields parameters. In this instance, the query will produce the number of cases in each projects with mutations in the gene ENSG00000155657.

1 curl "https://api.gdc.cancer.gov/analysis/top\_cases\_counts\_by\_genes?gene\_ids=ENSG00000155657&pretty=true"

This JSON-formatted output is broken up by project. For an example, see the following text:

```
"genes": {
                "my_genes": {
                  "gene_id": {
3
                    "buckets": [
                        "key": "ENSG00000155657",
                         "doc_count": 45
                    ],
                    "sum_other_doc_count": 0,
10
                    "doc_count_error_upper_bound": 0
                  },
12
                  "doc_count": 45
13
               },
14
                "doc_count": 12305
15
16
              "key": "TCGA-GBM",
17
              "doc count": 45
18
19
```

This portion of the output shows TCGA-GBM including 45 cases that have ssms in the gene ENSG00000155657.

Example 2: The following demonstrates a use of the /analysis/top\_mutated\_genes\_by\_project endpoint. This will output the genes that are mutated in the most cases in "TCGA-DLBC" and will count the mutations that have a HIGH or MODERATE impact on gene function. Note that the score field does not represent the number of mutations in a given gene, but a calculation that is used to determine which genes have the greatest number of unique mutations.

Example 3: The /analysis/top\_mutated\_cases\_by\_gene endpoint will generate information about the cases that are most affected by mutations in a given number of genes. Below, the file count for each category is given for the cases most affected by mutations in these 50 genes. The size of the output is limited to two cases with the size=2 parameter, but a higher value can be set by the user.

#### Survival Analysis Endpoint

1 curl

Survival plots are generated for different subsets of data, based on variants or projects, in the GDC Data Portal. The /analysis/survival endpoint can be used to programmatically retrieve the raw data used to generate these plots and apply different filters. Note that the fields and format parameters cannot be modified.

Example 1: A user wants to download data to generate a survival plot for cases from the project TCGA-DLBC.

"https://api.gdc.cancer.gov/analysis/survival?filters=%5B%7B%22op%22%3A%22%3D%22%2C%22content%22%3A%7B%22fie

```

294 }

Example 2: Here the survival endpoint is used to compare two survival plots for TCGA-BRCA cases. One plot will display survival information about cases with a particular mutation (in this instance: chr3:g.179234297A>G) and the other plot will display information about cases without that mutation. This type of query will also print the results of a chi-squared analysis between the two subsets of cases.

The output represents two sets of coordinates delimited as objects with the donors tag. One set of coordinates will generate a survival plot representing TCGA-BRCA cases that have the mutation of interest and the other will generate a survival plot for the remaining cases in TCGA-BRCA.

**Example 3:** Custom survival plots can be generated using the GDC API. For example, a user could generate survival plot data comparing patients with a mutation in genes associated with a biological pathway with patients without mutations in that pathway. The following example compares a patient with at least one mutation in either gene ENSG00000141510 or ENSG00000155657 with patients that do not have mutations in these genes.

# Chapter 5

# **BAM Slicing**

# **BAM Slicing**

The GDC API provides remote BAM slicing functionality that enables downloading of specific parts of a BAM file instead of the whole file. This functionality can be accessed at the slicing endpoint, using a syntax similar to that of widely used bioinformatics tools such as samtools.

# About the slicing endpoint

The slicing endpoint accepts HTTP GET requests in the form of a URL, and HTTP POST requests that carry a JSON payload. POST requests are more appropriate in cases where query parameters make the GET URL very long.

The response will be a BAM-formatted file containing the header of the source BAM file, as well as any alignment records that are found to overlap the specified regions, sorted by chromosomal coordinate.

Please note the following:

- The functionality of this API differs from the usual functionality of samtools in that alignment records that overlap multiple regions will not be returned multiple times.
- A request with no region or gene specified will return the BAM header, which makes it easy to inspect the references to which the alignment records were aligned.
- A request for regions that are not included in the source BAM is not considered an error, and is treated the same as if no records existed for the region.
- Examples provided for BAM slicing functionality are intended for use with GDC harmonized data (i.e. BAM files available in the GDC Data Portal). Slicing of unharmonized BAM files (i.e. BAM files in the GDC Legacy Portal) is not supported.
- Bam slicing does not create an associated bam index (.bai) file. For applications requiring a .bai file users will need to generate this file from the bam slice using a tool and command such as samtools index.

## **Query Parameters**

The following query parameters and JSON fields are supported:

Description	Query Parameter	JSON Field	Query format
entire chromosome, or a position or region on the chromosome, specified using chromosomal coordinates	region	regions	region=(:(-)?)?
region specified using a HGNC / GENCODE v22 gene name	gencode	gencode	gencode=

**NOTE:** The successfully sliced BAM will contain all reads that overlap (entirely or partially) with the specified region or gene. It is possible to specify an open-ended region, e.g. chr2:10000, which would return all reads that (completely or partially) overlap with the region of chromosome 2 from position 10,000 to the end of the chromosome.

#### JSON Schema

JSON payloads can be syntactically verified using the following JSON schema:

```
1 {
     "$schema": "http://json-schema.org/schema#",
2
     "type": "object",
3
4
     "properties": {
       "regions": {
         "type": "array",
6
         "items": {
           "type": "string",
8
           "pattern": "^[a-zA-Z0-9]+(:([0-9]+)?(-[0-9]+)?)?$"
         }
10
11
       },
       "gencode": {
12
         "type": "array",
13
         "items": {
14
           "type": "string"
15
         }
16
       }
17
18
19 }
```

# Examples: Specifying a region

The following two requests are examples of BAM slicing using region(s).

```
1
2 token=$(<gdc-token-text-file.txt)</pre>
4 curl --header "X-Auth-Token: $token"
      https://api.gdc.cancer.gov/slicing/view/df80679e-c4d3-487b-934c-fcc782e5d46e?region=chr1&region=chr2:10000&
      --output get_regions_slice.bam
1 {
      "regions": [
2
3
          "chr1",
          "chr2:10000",
4
          "chr3:10000-20000"
5
      ]
6
7 }
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token" --request POST
     https://api.gdc.cancer.gov/slicing/view/9ca90dfa-e62f-4f9c-9946-dfcecfd3ca4d --header "Content-Type:
     application/json" -d@Payload --output post_regions_slice.bam
1 Response:
2 HTTP/1.1 206
4 <bam_data_stream>
```

# Examples: Specifying a gene

The following two requests are examples of BAM slicing using HGNC / GENCODE v22 gene name(s).

```
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token"
      'https://api.gdc.cancer.gov/slicing/view/df80679e-c4d3-487b-934c-fcc782e5d46e?gencode=BRCA1' --output
     get_brca1_slice.bam
1 {
2
      "gencode": [
          "BRCA1",
3
          "BRCA2"
4
     ]
5
6 }
1 curl --header "X-Auth-Token: $token" --request POST
     https://api.gdc.cancer.gov/slicing/view/df80679e-c4d3-487b-934c-fcc782e5d46e --header "Content-Type:
     application/json" -d@Payload --output post_brca12_slice.bam
1 Response:
2 HTTP/1.1 206
```

After downloading, the sliced BAM file can be converted to SAM using the following command if samtools is installed on the user's system:

```
1 samtools view -h brca1_slice.bam -o brca1_slice.sam
```

#### **Errors**

4 <bam\_data\_stream>

When slicing cannot be performed, the GDC API will provide JSON error responses and HTTP error codes.

#### JSON Error Responses

JSON error responses have the following structure:

```
1 {
2    "error": "<error-message>"
3 }
```

For example, when making a request for a protected BAM without supplying a GDC authentication token:

```
1 curl https://api.gdc.cancer.gov/v0/slicing/view/15b0bf8e-ff20-41ab-8366-a495c11b30be
```

```
1 HTTP/1.1 403 FORBIDDEN
2 {
3     "error": "Please specify a X-Auth-Token"
4 }
```

#### HTTP error codes

Potential HTTP error codes include:

Error Code	Description
400	Bad Request – The regions specified are malformed
403	Unauthorized – The user could not be authenticated
403	Unauthorized – The user is not authorized for access to the source BAM
404	Not Found – No BAM is specified
404	Not Found – No BAM can be found for the specified GDC BAM ID
504	BAI Not Found – No BAI can be found for the BAM

# **Transfer Errors**

In the case that an error occurs during transfer of the resulting BAM, the BGZF EOF marker will not be present. This early truncation of the BAM file will cause errors if the file is used as input to other programs. For example, samtools will provide the error "EOF marker is absent".

Early truncation can arise when connection is interrupted or when slicing fails due to BAM corruption.

# Chapter 6

# **Submission**

## Submission

# Overview

The GDC Submission API uses methods and endpoints that are distinct from those that drive the functionality of the GDC Data Portal. In particular, data and metadata that are in the process of being submitted can only be queried using GraphQL.

This section describes the GDC API's submission functionality, including methods for submitting, deleting, updating, searching, and retrieving data and metadata.

# Submission endpoint

## Constructing the endpoint URL

The endpoint for submitting data to a specific project in the GDC is constructed as follows:

1 https://api.gdc.cancer.gov/[API\_version/]submission/Program.name/Project.code

where **API\_version**/] is the optional API version component (see [Getting Started).

The values of Program.name and Project.code can be obtained from the project URL on the GDC Data Submission Portal:

1 https://portal.gdc.cancer.gov/submission/Program.name/Project.code/dashboard

For more information about program name and project code see The GDC Data Model section.

#### Example

The following are URL examples for a project with Program.name "TCGA" and Project.code "ALCH":

- Submission Portal URL: https://portal.gdc.cancer.gov/submission/TCGA/ALCH/dashboard
- API submission endpoint (versioned): https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH
- API submission endpoint (unversioned): https://api.gdc.cancer.gov/submission/TCGA/ALCH

#### Submission Formats

#### Metadata Formats

#### JSON and TSV

The GDC API accepts project metadata in JSON and TSV formats for the purpose of creating entities in the GDC Data Model. This includes clinical and biospecimen metadata such as disease name and stage, patient age, sample type, and certain details about the types of data collected. Upon successful data submission and project release, this metadata is indexed and becomes available for queries by data users via the GDC Data Portal and the GDC API. See GDC Data Model (below) for information on accepted metadata elements and instructions for obtaining templates for metadata submission.

Content-Type Header JSON is the default format for metadata submission. Submission API calls with JSON payloads should include the HTTP header Content-Type: application/json. Requests with TSV payloads must instead include the header Content-Type: text/tsv.

Binary Mode Metadata files must be uploaded in raw, unencoded form. Binary mode should be used, if available, to ensure that file contents are not encoded by the upload tool before transmission. For example, when using the curl command-line tool, the --data-binary switch should be used instead of --data. The --data-binary switch is required for uploading TSV files.

#### **BCR XML**

While JSON and TSV are the recommended formats for submitting metadata, the GDC API can also extract metadata elements from BCR XML files. Users wishing to submit metadata as BCR XML must contact GDC User Services and ensure that appropriate element mapping is in place before initiating XML submission.

To submit BCR XML, make PUT requests with the Content-Type: application/xml header to the following URLs, replacing Program.name and Project.code as desribed in Submission Endpoint (above):

- $0. \ \ For \ Biospecimen \ BCR \ XML: \ \texttt{https://api.gdc.cancer.gov/v0/submission/Program.name/Project.code/xml/biospecimen/Propositional Project.code/xml/biospecimen/Propositional Project.code/xml/biospecimen/Propositional Project.code/xml/biospecimen/Propositional Project.code/xml/biospecimen/Propositional Project.code/xml/biospecimen/Project.code/xml/biospecimen/Propositional Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.code/xml/biospecimen/Project.$
- 1. For Clinical BCR XML: https://api.gdc.cancer.gov/v0/submission/Program.name/Project.code/xml/clinical/bcr/.

Biospecimen BCR XML creates Case entities in the GDC Data Model, whereas Clinical BCR XML does not. Unless the associated cases already exist in the GDC, Biospecimen BCR XML must be uploaded before Clinical BCR XML.

BCR XML files can be submitted in dry run mode, described below, by appending \_dry\_run to the above URLs.

The following is a sample shell command for submitting an XML file:

```
1 curl --request PUT --header "X-Auth-Token: $token" --header 'Content-Type: application/xml'
--data-binary @biospecimen.xml
'https://api.gdc.cancer.gov/v0/submission/GDC/INTERNAL/xml/biospecimen/bcr/_dry_run'
```

**NOTE:** A typical BCR XML file contains more information than what is extracted and indexed by the GDC. XML files submitted to the above endpoints are not retained or distributed to GDC data users, so the same files should also be submitted as data files (i.e. as clinical or biospecimen supplements).

### **Data File Formats**

The GDC API accepts a variety of data files after their metadata has been registered: BAM and FASTQ files, clinical and biospecimen supplements, slide images, and other file types. Supported data file formats are listed on the GDC website.

## GDC Data Model

Submitters should review the GDC Data Model documentation and the GDC Data Dictionary before initiating submission.

#### **UUIDs**

Submitters can assign UUIDs to all submittable entities other than those that correspond to files (entities in categories data\_file or metadata\_file). If the submitter does not provide a UUID, it will be assigned by the GDC and returned in the API response upon successful completion of the submission transaction. See Appendix C for details of the API response format. To learn more about UUIDs see the GDC Data Model documentation.

#### Submitter IDs

In addition to id, many entities also include a submitter\_id field. This field can contain any string (e.g. a "barcode") that the submitter wishes to use to identify the entity. Typically this string identifies a corresponding entry in submitter's records. The GDC's only requirement with respect to submitter\_id is that it be a string that is unique for all entities within a project. The GDC Submission API requires a submitter\_id for most entities.

Note: For case entities, submitter\_id must correspond to a submitted\_subject\_id of a study participant registered with the project in dbGaP.

## **GDC Data Dictionary Endpoints**

Information in the GDC Data Dictionary can be accessed programmatically as described below.

#### **Submission Templates**

Submission templates are accessible programmatically at the templates endpoint. Template format (json, tsv or csv) is specified using the format parameter.

For example, the JSON template for case entities can be obtained from:

1 https://api.gdc.cancer.gov/v0/submission/template/case?format=json

In addition to case, templates for the following entities can be downloaded

#### Biospecimen:

- 1 sample
- 2 portion
- 3 analyte
- 4 aliquot
- 5 read\_group

#### Clinical:

- 1 slide
- 2 demographic
- 3 diagnosis
- 4 exposure
- 5 family\_history
- 6 treatment
- 7 follow\_up

#### Data Files:

- 1 analysis\_metadata
- 2 biospecimen\_supplement
- 3 clinical\_supplement
- 4 experiment\_metadata
- 5 pathology\_report
- 6 run\_metadata
- 7 slide\_image

```
8 submitted_unaligned_reads
9 submitted_aligned_reads
10 submitted_genomic_profile
```

#### **Entity JSON Schemas**

The entire collection of GDC entity schemas can be downloaded from the dictionary endpoint:

```
1 https://api.gdc.cancer.gov/v0/submission/_dictionary/_all
```

Individual schemas can be downloaded by specifying entity type. For example, the JSON schema for case entities can be found at:

```
1 https://api.gdc.cancer.gov/v0/submission/_dictionary/case
```

# Making Requests to the Submission API

Requests to create or update entities in the GDC must specify the entity type, the entity id or submitter\_id, relationships (links) that the entity has to existing entities in the GDC Data Model, and entity properties as defined by the GDC Data Dictionary. To delete entities, only the id property is required. The general format of GDC API submission requests and responses is provided in Appendix C.

#### Submission Transactions

Submission of data to the GDC involves a series of transactions initiated by the submitter, that create and link entities according to the GDC Data Model. With the exception of program, which is an administrative entity created by the GDC, all new entities must be linked, at creation, to existing entities or to new entities being created in the same transaction. For example, a submitter cannot create a portion entity unless the submitter either (1) has previously created the corresponding case and sample entities, or (2) is creating those entities in the same transaction. This also means that entities cannot be deleted if they have "child" entities attached to them.

If multiple entities are being created and/or updated in a transaction, and an error is encountered for one of the entities, then the transaction will fail and no changes will be made to the GDC.

#### **Dry Run Transactions**

The submission endpoint provides a \_dry\_run mode that simulates submission transactions without making changes to the GDC. This mode is activated by appending /\_dry\_run to the end of a submission endpoint.

The following is an example of a POST request, that simulates creating an entity in dry run mode:

```
1 {
2    "project_id": "TCGA-ALCH",
3    "type": "case",
4    "submitter_id": "TCGA-ALCH-000001",
5    "projects": {
6        "code": "ALCH"
7    }
8 }
```

```
1 {
     "cases_related_to_created_entities_count": 0,
2
     "cases_related_to_updated_entities_count": 0,
3
    "code": 200,
     "created_entity_count": 1,
     "entities": [
       {
7
         "action": "create",
8
         "errors": [],
9
10
         "id": "61f48d1c-9439-448c-a90c-d6dbe76b3654",
         "related_cases": [],
11
         "type": "case",
12
         "unique_keys": [
13
14
             "project_id": "TCGA-ALCH",
15
16
             "submitter id": "TCGA-ALCH-000001"
           }
17
         ],
18
         "valid": true,
19
20
         "warnings": []
       }
21
    ],
22
     "entity_error_count": 0,
23
    "message": "Transaction would have been successful. User selected dry run option, transaction aborted,
24
        no data written to database.",
     "success": true,
25
     "transaction_id": null,
26
     "transactional_error_count": 0,
27
     "transactional_errors": [],
     "updated_entity_count": 0
29
30 }
```

# Dry Run Commit

5 }

For convenience, the GDC enables users to commit earlier \_dry\_run transactions instead of uploading the same data again to execute the changes. This commit action is allowed on transactions that (1) have not been previously committed and (2) were successful dry\_run transactions.

Note that the commit action is a separate transaction with its own transaction id, and it can be executed asynchronously. If the state of the submission project has changed in a way that would make the original \_dry\_run transaction invalid if it were run again (e.g. entities with the same submitter\_id have since been created in another transaction), then then commit action will fail.

To commit a transaction, submit a POST or PUT request to /submission/Program.name/Project.code/transactions/transaction\_replacing Program.name, Project.code, and transaction\_id with values associated with the transaction.

```
token=$(<gdc-token-text-file.txt)

curl --header "X-Auth-Token: $token" --request POST
    https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH/transactions/467/commit?async=true

{
    "code": 200,
    "message": "Transaction submitted.",
    "transaction_id": 468,</pre>
```

#### Dry Run Close

The GDC Submission API also provides a close action on \_dry\_run transactions. This close action is allowed on \_dry\_run transactions that have not been previously closed. Closing a \_dry\_run transaction prevents it from being committed in the future.

To close a transaction, submit a POST or PUT request to /submission/Program.name/Project.code/transactions/transaction\_id/replacing Program.name, Project.code, and transaction\_id with values associated with the transaction.

```
token=$(<gdc-token-text-file.txt)

curl --header "X-Auth-Token: $token" --request POST
    https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH/transactions/467/close

{
    "code": 200,
    "message": "Closed transaction.",
    "transaction_id": 467
}</pre>
```

## **Asynchronous Transactions**

The submission endpoint provides an asynchronous mode that provides immediate response and executes submission transactions in the background. This mode is activated by appending <code>?async=true</code> to the end of a submission endpoint. The API will respond with the <code>transaction\_id</code> which can be used to look up the result of the transaction at a later time via the GraphQL endpoint. If the server has too many asynchronous jobs scheduled already, your request to schedule a transaction may fail.

#### Example

1 {

The following is an example of a PUT request, that creates a case asynchronously:

```
"project_id": "TCGA-ALCH",
2
    "type": "case",
3
    "submitter_id": "TCGA-ALCH-000001",
    "projects": {
5
6
      "code": "ALCH"
7
8 }
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token" --request POST --data-binary @Request --header 'Content-Type:
      application/json' https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH?async=true
1 {
    "code": 200,
    "message": "Transaction submitted.",
3
    "transaction_id": 467,
4
5 }
```

The following is a GraphQL request that looks up the state of the above transaction:

```
1 query {
2   transaction_log(id: 467) {
3   is_dry_run
4   committed_by
5   state
6  }
7 }
```

```
1 {
     "data": {
2
       "transaction_log": [
3
4
           "committed_by": null,
5
           "is_dry_run": false,
           "state": "FAILED"
         }
       ]
9
10
    }
11 }
```

#### **Transaction Status**

The following transaction fields can be queried using GraphQL and are helpful in determining the status of a transaction:

Field	Type	Description
id	ID	Transaction identifier
is_dry_run	Boolean	Indicates whether the transaction is a dry run
closed	Boolean	For dry run transactions, indicates whether the transaction has been closed to prevent it from being committed in the future.
committable	Boolean	Indicates whether the transaction can be committed (i.e. it is a successful dry run transaction that has not been committed previously and has not been closed)
state	String	Indicates the state of the transaction: PENDING, SUCCEEDED, FAILED (due to user error), or ERRORED (due to system error)
committed_by	ID	The ID of the transaction that committed this transaction

**Note:** To check whether a dry run transaction was committed successfully, check the **state** of the transaction that executed the commit. The **state** of the dry run transaction itself does not represent the status of a subsequent commit.

# Creating and Updating Entities

The GDC Submission API supports HTTP POST and HTTP PUT methods for creating entities:

- POST will create entities that do not exist, and will fail if any of the entities in the transaction already exist in the GDC.
- **PUT** will create new entities and update existing entities, and identify which entities were created or updated in the API response.

The GDC suggests using POST for creating new entities, and using PUT only for updating entities. This helps to avoid inadvertent entity updates that can occur when using PUT for creating entities.

**Note:** Once a relationship has been created between two entities, it cannot be removed by updating an entity. To remove a relationship, the child entity must be deleted.

#### Example: Creating and Updating Case Entities (JSON)

In this example, a case entity is created using POST. Then an attempt is made to create the same entity again using POST, resulting in an error. Then the originally created entity is updated (with the same information) using PUT.

The JSON in the request was generated using the case JSON template that can be obtained from the GDC Data Dictionary Viewer and from https://api.gdc.cancer.gov/v0/submission/template/case?format=json.

Note: For case entities, submitter\_id must correspond to a submitted\_subject\_id of a study participant registered with the project in dbGaP.

```
1 {
    "type": "case",
2
    "submitter_id": "TCGA-ALCH-000001",
3
    "projects": {
       "code": "ALCH"
6
7
8 }
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token" --request POST --data-binary @Request --header 'Content-Type:
      application/json' https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH
1 {

# Example: Creating an Aliquot Entity (JSON)

In this example, an aliquot entity and a sample entity are created in a single transaction. The aliquot is linked to sample which is linked to case. The first request is an example of using submitter\_id properties to link entities together. The second request is an example of using UUIDs for creating the links.

#### Request 1: Creating Links Using submitter\_id

16

```
1 [
2
    {
      "type": "sample",
3
      "submitter_id": "TCGA-ALCH-000001-SAMPLE000001",
4
      "sample_type": "Primary Tumor",
      "sample_type_id": "01",
      "cases": {
         "submitter_id": "TCGA-ALCH-000001"
9
    },
10
11
12
      "type": "aliquot",
      "submitter_id": "TCGA-ALCH-000001-SAMPLE000001-ALIQUOT000001",
13
      "samples": {
14
         "submitter_id": "TCGA-ALCH-000001-SAMPLE000001"
15
16
17
    }
18 ]
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token" --request POST --data-binary @Request --header 'Content-Type:
      application/json' https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH
1 {
    "cases_related_to_created_entities_count": 1,
    "cases_related_to_updated_entities_count": 0,
    "code": 201,
    "created_entity_count": 2,
    "entities": [
6
         "action": "create",
8
9
         "errors": [],

# **Retrieving Entities**

### **Entities Endpoint**

JSON objects representing submitted entities can be retrieved with a GET request to the entities endpoint. This endpoint retrieves entities by UUID. A single UUID or a comma-separated list of UUIDs can be passed to this endpoint as a query.

```
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token"
      https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH/entities/fbf69646-5904-4f95-92d6-692bde658f05
1 {
2
     "entities": [
3
4
         "program": "TCGA",
         "project": "ALCH",
         "properties": {
6
           "created_datetime": "2016-04-14T08:44:43.361800-05:00",
           "id": "fbf69646-5904-4f95-92d6-692bde658f05",
           "project_id": "TCGA-ALCH",
           "projects": [
10
               "id": "d9906779-f1da-5d9f-9caa-6d5ecb2e3cd6",
12
13
               "submitter_id": null
             }
14
15
           ],
           "state": "validated",
16
           "submitter_id": "TCGA-ALCH-000001",

           "type": "case",
18
           "updated_datetime": "2016-04-14T21:29:28.401212-05:00"
19
         }
20
21
22
23 }
```

### Export Endpoint

46

The export endpoint provides additional functionality for exporting entities from the GDC submission system. The ids parameter accepts a UUID or a comma-separated list of UUIDs. The format parameter allows the user to specify the preferred format of the API response: JSON, TSV, or CSV. When the with\_children parameter is set to with\_children, the response includes the metadata stored in all "child" entities of the entity being requested. The export endpoint accepts GET requests.

```
1 token=$(<gdc-token-text-file.txt)</pre>
2
4 curl --header "X-Auth-Token: $token"
       'https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH/export?ids=11f8321-832f-4a8b-8384-a2f6256557e0&format=js

```

## GraphQL

Submitters can use the GraphQL query language for advanced search and retrieval of data from the GDC Submission Portal. See GraphQL for more information.

# Deleting Entities

The entities endpoint can also be used to delete entities. This is accomplished using a DELETE request to the endpoint, specifying the entity's UUID. If an entity cannot be deleted because it is linked to child entities, the GDC Submission API will respond with an error providing a list of entities that must be deleted prior to deleting the subject entity.

A subgraph (a parent along with all of its child entities) can be deleted in a single transaction by passing a comma-separated list of UUIDs to the entities endpoint.

Entities in submitted state (assigned when the project has been submitted) cannot be deleted.

```
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --header "X-Auth-Token: $token" --request DELETE
      https://api.gdc.cancer.gov/v0/submission/TCGA/ALCH/entities/67782964-0065-491d-b051-2ae404bb734d
2
     "code": 200,

     "transactional_error_count": 0,
     "transactional_errors": []
21
22 }
```

# Working With Files

#### Uploading Data Files

Experimental data files like BAM and FASTQ can be uploaded directly to the API using the files endpoint, by specifying the UUID of the corresponding data\_file entity. Binary upload mode must be used if available. Uploading large files may be more efficiently performed using the GDC Data Transfer Tool.

```
1 token=$(<gdc-token-text-file.txt)
2</pre>
```

#### **Upload Manifest**

The manifest endpoint generates a manifest for uploading files using the GDC Data Transfer Tool. It requires a comma-separated list of file UUIDs to generate a manifest.

1 https://api.gdc.cancer.gov/v0/submission/PROGRAM/PROJECT/manifest?ids=bf0751ca-fc3b-4760-b876-0fefce040be5,90163

## Downloading Files

Files in file state = validated can be downloaded by the submitter using the API or the Data Transfer Tool. This is done in a similar manner as files available in the Data Portal, but will require submission access to the particular project in dbGaP as opposed to downloader access. File UUIDs can be found in the original upload manifest file, the submission portal, or by API calls. See Downloading Files for details.

# **Deleting Files**

Uploaded files can be deleted by deleting the entity that corresponds to the file. See Deleting Entities for details.

# Querying Submitted Data Using GraphQL

# GraphQL Overview

GraphQL is a query language that makes it easy to search and retrieve data from graph data structures such as the GDC Data Model.

Unlike the methods outlined in Search and Retrieval, which provide access to public releases (or snapshots) of GDC data, the /graphql endpoint of GDC Submission API makes it possible for submitters to access "live" data, which provides a real-time view of the state of entities in a project.

**NOTE:** Access to GDC Submission API GraphQL service is limited to authorized and authenticated submitters. Submitters may only access data in their own project using GraphQL.

# GraphQL IDE

The GDC GraphQL IDE is an instance of GraphiQL, an in-browser GraphQL IDE that facilitates construction and execution of GraphQL queries. The GDC GraphQL IDE provides tab-completion and syntax checking using schema from the GDC Data Dictionary. It can be found at <a href="https://gdc-portal.nci.nih.gov/submission/graphiql">https://gdc-portal.nci.nih.gov/submission/graphiql</a>.

Before interacting directly with the GDC Submission API's GraphQL endpoint, users are encouraged to become familiar with executing queries using the GDC GraphQL IDE.

## GraphQL Endpoint

GDC data submitters can access the GDC Submission API GraphQL endpoint at:

```
1 https://api.gdc.cancer.gov/[API_version/]submission/graphql
```

where **API\_version**/] is the optional API version component (see [Getting Started).

**NOTE:** An authentication token is required for all requests to the **graphql** endpoint. Queries are restricted to those projects for which the submitter has obtained authorization.

## Constructing a Query

When sending GraphQL requests to the API directly, the bare GraphQL query must be wrapped in a "query" JSON object as shown below:

When using the GDC GraphQL IDE, the bare JSON query must be used without a JSON wrapper.

#### Bare GraphQL query

In its simplest form, a GraphQL query is a **selection set** (curly brackets) that encloses a set of **fields**. The selection set defines the set of information that is to be retrieved. Furthermore, in GraphQL fields are conceptually equivalent to functions that retrieve additional fields and, in some cases, can take arguments. So each field in a selection set can have its own selection set, thereby creating a nested query structure that can navigate complex data relationships. See GraphQL Specification for further details.

In GDC GraphQL IDE, a root field (field within the outermost/umbrella selection set) typically corresponds to an entity, whereas fields inside nested selection sets are typically a combination of entities and entity properties.

The "Docs" panel on the right-hand side of the GDC GraphQL IDE allows users to discover the fields that can be queried with GraphQL. Note that the panel contains a lot of information and users may experience a delay before it is displayed.

A simple GraphQL query looks like this:

```
1 {
2   case (project_id: "TCGA-ALCH", first: 0) {
3    id
4    submitter_id
5    }
6   }
7   _case_count (project_id: "TCGA-ALCH")
8 }
```

The query above has two root fields: case and \_case\_count. The case field corresponds to the case entity in the GDC Data Model. The query supplies two arguments to the field:

- 1. project\_id: "TCGA-ALCH", which requests only cases in the TCGA-ALCH project.
- 2. first: 0, which requests that the API provide all results in the response, without pagination (a nonzero positive integer value of first specifies the number of results to return, 10 by default; "pages" are selected using offset).

The \_case\_count field is a special field that returns the number of cases that match the supplied argument.

The bare query above can be used as is in the GraphQL IDE. In order to pass this query to the GDC API directly, it needs to be further processed as described below.

#### Passing GraphQL queries to GDC API directly

Before a bare GraphQL query is passed to the GDC API, it must be processed as follows:

- 1. Escape the query using JSON string rules
- 2. Wrap the query in a "query" JSON object.
- 3. Pass the query to the graphql endpoint in an HTTP POST request.

Using the case and \_case\_count example above as the starting point, the results are as follows:

```
1 {
2
      case (project_id: "TCGA-ALCH", first: 0) {
3
           submitter id
4
5
6
       _case_count (project_id: "TCGA-ALCH")
8 }
1 {\n\tcase (project_id: \"TCGA-ALCH\", first: 0) {\n\t\tid\n\t\tsubmitter_id\n\n\t}\n\t_case_count
      (project_id: \"TCGA-ALCH\")\n}
1 {
2
       "query": "{\n\tcase (project_id: \"TCGA-ALCH\", first: 0)
           {\n\t\tid\n\t\tsubmitter_id\n\n\t}\n\t_case_count (project_id: \"TCGA-ALCH\")\n}",
       "variables": null
3
4 }
1 token=$(<gdc-token-text-file.txt)</pre>
3 curl --request POST --header "X-Auth-Token: $token" 'https://api.gdc.cancer.gov/v0/submission/graphql'
      --data-binary @Query_json
1 {
2
    "data": {
3
      "_case_count": 20,
      "case": [
         {

           "submitter_id": "TCGA-ALCH-000012"
83
```

```
84 }
85 ]
86 }
87 }
```

## Additional Examples

#### Example: File UUID

GraphQL query to find the file UUID based on file submitter\_id:

```
1 {
2
    submitted_unaligned_reads (project_id: "GDC-INTERNAL", submitter_id:
3
        "Blood-00001-aliquot_lane1_barcode23.fastq") {
      id
4
      submitter_id
      file_name
      project_id
8 }
9 }
1 {
      "query": "{\n \n submitted_unaligned_reads (project_id: \"GDC-INTERNAL\", submitter_id:
          \"Blood-00001-aliquot_lane1_barcode23.fastq\") {\n
                                                                  id\n
                                                                          submitter_id\n
                                                                                             file_name\n
          project_id\n}\n}",
3
      "variables": null
4 }
1 curl --request POST --header "X-Auth-Token: $token" 'https://api.gdc.cancer.gov/v0/submission/graphql
      --data-binary @escaped\_GraphQL
1 {
    "data": {
2
      "submitted_unaligned_reads": [
3
          "file_name": "dummy.fastq",
5
          "id": "616eab2f-791a-4641-8cd6-ee195a10a201",
          "project_id": "GDC-INTERNAL",
          "submitter_id": "Blood-00001-aliquot_lane1_barcode23.fastq"
        }
9
10
11
```

## **Example: Case Without Diagnosis**

12 }

GraphQL query for any one case in 'TCGA-LUAD' without Diagnosis information:

```
1 {
2  case (project_id: "TCGA-LUAD", without_links: ["diagnoses"], first: 1) {
3    submitter_id
4  }
5 }
```

## **Example: Number of Cases Without Diagnosis**

GraphQL query for the number of cases in 'TCGA-LUAD' without Diagnosis information:

```
1 {
2    _case_count (project_id: "TCGA-LUAD", without_links: ["diagnoses"])
3 }

1 {
2     "data": {
3         "_case_count": 5
4     }
5 }
```

### **Example: Aliquot State**

Query for the state of aliquots belonging to case with submitter\_id: "TCGA-ALCH-000001":

"id": "7af58da0-cb3e-43e2-a074-4bd8f27565ba",

"state": "validated"

```
Example: Aliases
```

}

6

8

9 } 10 }

GraphQL query that uses a GraphQL fragment to get specific properties from two portions and give them aliases in the response:

```
8 }
9
10 fragment portionProperties on portion {
    submitter_id
12
    is_ffpe
13 }
1 {
     "data": {
2
3
       "some_portion": [
4
           "is_ffpe": false,
5
           "submitter_id": "TCGA-62-A471-10A-01"
         }
      ],
8
9
       "specific_portion": [
10
           "is_ffpe": false,
11
           "submitter_id": "TCGA-67-6217-01A-13-2191-20"
12
13
      ]
14
15
    }
16 }
```

#### Example: Biospecimen Tree

GraphQL Query for a case in "TCGA-LUAD" and return a biospecimen tree:

```
1 {
    case(project_id: "TCGA-LUAD", first: 1) {
3
      samples(first: 1) {
4
5
         id
         portions(first: 1) {
6
           id
           analytes(first: 1) {
             id
9
10
             aliquots(first: 1) {
               id
11
12
           }
13
14
         }
      }
15
16
17 }
```

```
1 {
    "data": {
2
      "case": [
3
4
           "id": "19ca36e6-2154-4224-89b1-117a4a4407f6",
           "samples": [
6
               "id": "5e2625d2-290d-48cd-af5c-27dc8e3c8b6a",
               "portions": [
9
                 {
10
11
                   "analytes": [
```

```
12
                       "aliquots": [
13
14
                          "id": "8e1820d5-dcd8-4760-9962-221e2b71d4b9"
15
16
17
                       ],
                       "id": "6449533c-e52a-4e58-bae7-0732f48153ef"
18
                     }
19
                   ],
20
                   "id": "26b75643-8fcd-445e-a0e0-9868cac589ea"
21
22
              ]
23
            }
24
          ]
25
        }
26
27
   }
28
29 }
```

## Chapter 7

# System Information

## **System Information**

## Overview

The GDC API offers endpoints that provide information about the system. These endpoints are described below.

## **GDC Notifications Endpoint**

The notifications endpoint provides current user-facing notifications.

GDC notifications have a corresponding level with the following meanings:

Level	Meaning
INFO	Non-essential information, e.g. regarding a new dataset
WARNING	Important user information, e.g. regarding a dataset to be removed
ERROR	Important system information, e.g. regarding a GDC component
DEBUG	Unimportant system information, e.g. testing the notification system

Notifications will indicate the GDC components to which they apply:

Component	Description
PORTAL	The GDC Data Portal
LEGACY	The GDC Legacy Archive
SUBMISSION	The GDC Data Submission Portal
DOCUMENTATIONThe GDC documentation site that contains GDC user guides, release notes, and the GDC Data Dictionary	
WEBSITE	The GDC project website that includes information about the system. This does not include any of the above-listed GDC components.

## Sample Request

```
1 curl --request GET https://api.gdc.cancer.gov/v0/notifications
```

```
1 {
     "data": [
2
      {
3
         "level": "INFO",
4
         "components": [
5
           "SUBMISSION_API",
6
           "LEGACY_API"
7
         "message": "The system is up!"
9
10
11
12 }
```

## **API Status Endpoint**

The status endpoint provides information about the current status and version of the GDC API.

## Sample Request

```
curl https://api.gdc.cancer.gov/status

import requests
import json

status_endpt = 'https://api.gdc.cancer.gov/status'
response = requests.get(status_endpt)
print json.dumps(response.json(), indent=2)

{
    "commit": "74e1e3583c0f39fbf2149322addb7378206be3b9",
    "status": "0K",
    "tag": "1.2.0",
    "version": 1

6 }
```

## Chapter 8

# **Additional Examples**

## **Additional Examples**

## Data Search and Retrieval

## **Endpoint Examples**

This section contains additional examples for using endpoints.

#### Project Endpoint Example

This example is a query for Projects contained in GDC. It returns only the first five projects sorted by project name.

 ${\tt 1 \ curl \ 'https://api.gdc.cancer.gov/projects?from=0\&size=5\&sort=project.name:asc\&pretty=true'}$ 

```
1 {
    "data": {
2
      "hits": [
3
4
           "state": "legacy",
           "project_id": "TARGET-AML",
           "primary_site": "Blood",
           "disease_type": "Acute Myeloid Leukemia",
           "name": "Acute Myeloid Leukemia"
        },
10
           "state": "legacy",
12
13

## Filters Examples

This section contains additional examples for using the filters parameter.

#### Example: Basic syntax

The following is an example of filters syntax, including the JSON object passed to the filters parameter, the corresponding API query, and the JSON object returned by the API. The example finds projects where the primary site is Blood.

```
1 {
     "op": "and",
2
     "content": [
3
4
         "op": "in",
5
         "content": {
           "field": "primary_site",
7
           "value": [
              "Blood"
9
10
         }
11
       }
12
    ]
13
14 }
```

1 curl

'https://api.gdc.cancer.gov/projects?filters=%7b%0d%0a++%22op%22%3a+%22and%22%2c%0d%0a++%22content%22%3a+%5b

```
"released": true,
9
           "state": "legacy",
10
           "primary_site": [
11
              "Blood"
12
13
           "project_id": "TARGET-AML",
14
           "id": "TARGET-AML",
15
           "name": "Acute Myeloid Leukemia"
16
         }
17
18
       ],
       "pagination": {
19
20
         "count": 1,
         "sort": "",
21
22
         "from": 0,
         "page": 1,
23
24
         "total": 1,
         "pages": 1,
25
         "size": 10
26
27
28
     },
29
     "warnings": {}
30 }
```

## Example: Filter cases keeping only 'male'

This is an example of a value-based filter:

```
1 {
2    "op": "=" ,
3    "content": {
4         "field": "cases.demographic.gender" ,
5          "value": [ "male" ]
6    }
7 }
```

1 curl

## Example: Filter using a range

This is an example of filtering for age at diagnosis. The request is for cases where the age at diagnosis is between 40 and 70 years. *Note:* age\_at\_diagnosis is expressed in days.

```
1 {
2
       "op": "and",
3
       "content": [
           {
4
                "op": ">=",
5
                "content": {
                    "field": "cases.diagnoses.age_at_diagnosis",
                    "value": [
                         14600
9
                    ]
10
                }
11
           },
12
13
                "op": "<=",
14
```

```
"content": {
15
                    "field": "cases.diagnoses.age_at_diagnosis",
16
                    "value": [
17
                         25550
18
                    ]
19
                }
20
           }
21
       ]
22
23 }
```

1 curl

'https://api.gdc.cancer.gov/cases?filters=%7B%22op%22:%22and%22,%22content%22:%5B%7B%22op%22:%22%3E%3D%22,%22

### Example: Multiple fields

Filter projects for primary\_site being Kidney or Brain and program.name being TCGA

```
1 {
        "op" : "and" ,
2
        "content" : [{
3
                 "op" : "in" ,
                 "content" : {
                     "field" : "primary_site" ,
                     "value" : [
                          "Kidney" ,
                          "Brain"
9
                     ]
10
                 }
11
            }, {
12
                 "op" : "in"
13
                 "content" : {
14
                     "field" : "program.name" ,
15
                     "value" : [
16
                          "TCGA"
17
                     ]
18
19
                 }
20
            }]
21 }
```

1 curl

'https://api.gdc.cancer.gov/projects?filters=%7B%22op%22%3A%22and%22%2C%22content%22%3A%5B%7B%22op%22%3A%22i

## Chapter 9

# Appendix A: Available Fields

## Appendix A: Available Fields

The GDC API's search and retrieval endpoints provide access to fields that correspond to properties defined in the GDC Data Dictionary. This appendix contains a list of fields available at each endpoint, and a list of field groups accessible via the expand parameter.

## Field Listing by Endpoint

## **Project Fields**

```
Field Name
dbgap_accession_number
disease type
name
primary_site
project\_id
released
program.dbgap_accession_number
program.name
program.program_id
summary.case_count
summary.file_count
summary.file_size
summary.data_categories.case_count
summary.data_categories.data_category
summary.data_categories.file_count
summary.experimental_strategies.case_count
summary.experimental strategies.experimental strategy
summary.experimental strategies.file count
```

# Appendix B: Key Terms

### Appendix B: Key Terms

The following table provides definitions and explanations for terms and acronyms relevant to the content presented within this document.

Term	Definition
ACL	Access Control List
API	Application Programming Interface
BAM	Bidirectional Associative Memory
BCR	Biospecimen Core Resource
CSV	Comma Seperated Values
DCC	Data Coordinating Center
eRA	Electronic Research Administration
GDC	Genomic Data Commons
HTTP	Hypertext Transfer Protocol
IDE	Integrated Development Environment
JSON	JavaScript Object Notation
MAGE-TAB	Microarray Gene Expression - Tabular format
NCI	National Cancer Institute
NIH	National Institutes of Health
Op	Operations
REST	Representational State Transfer
TARGET	Therapeutically Applicable Research to Generate Effective Treatments
TCGA	The Cancer Genome Atlas
TSV	Tab Seperated Values
UUID	Universally Unique Identifier
URL	Universal Resource Locator
XML	Extensible Markup Language

# Chapter 11

# Appendix C: Format of Submission Queries and Responses

#### Appendix C: Format of Submission Requests and Responses

#### Format of Submission Request

The general format of JSON objects submitted to the GDC API is as follows:

```
1 {
2
       "type": string,
       "id": string,
3
       "submitter_id": string,
4
       ""roperties>": any type,
       "<relationship_name>": [
                "id": string,
                "submitter_id": string
           },
10
           . . .
       ]
12
13 }
```

The request must specify either an id or a submitter\_id.

id: A string specifying the id of the node that the user is creating or updating. This is the persistent GDC UUID4 for the node. If it is preferred to refer to the node using a custom id, users can do so with the submitter\_id field (described below).

submitter\_id: A string specifying the custom id of the object the user is creating or updating. This is not the official GDC ID for the node.

cproperties>: These key-value pairs will be applied to properties on the referenced node.

<relationship\_name>: A JSON object that specifies a relationship (link) between the node and other nodes. Links are typically
established using the submitter\_id or id of the neighboring node.

#### Format of API Response to a Submission Request

The following fields are included in all API responses to submission requests.

```
1 {
2    "cases_related_to_created_entities_count": int,
3    "cases_related_to_updated_entities_count": int,
```

```
4
    "code": int,
5
    "created_entity_count": int,
     "entities": [entities],
6
     "entity_error_count": int,
8
     "message": string,
9
     "success": boolean,
10
     "transaction_id": string,
     "transactional_error_count": int,
     "transactional_errors": [transactional_errors],
12
13
     "updated_entity_count": int
14 }
```

cases related to created entities count: Number of cases related to the created entities.

cases\_related\_to\_updated\_entities\_count: Number of cases related to the updated entities.

code: The HTTP status code of the response message.

created\_entity\_count: Number of entities created.

entities: A list of entities of the form:

```
1 {
2
     "action": string,
    "errors": [entity_errors],
3
4
    "id": string,
    "related_cases": [object],
6
    "type": string,
    "unique_keys": [unique_keys],
     "valid": boolean,
8
9
    "warnings": [object]
10 }
```

entity\_errors: A list of errors that occurred while parsing, validating, or performing a CRUD operation on a specific entity. Entity errors are of the form:

```
1 {
2    "keys": [string],
3    "message": string
4 }
```

unique\_keys: Properties, or combinations of properties, that can be used to uniquely identify the node in the GDC. Unique\_keys are of the form:

```
1 {
2    "project_id": string,
3    "submitter_id": string
4 }
```

entity\_error\_count: Number of entities that were not successful.

message: A human-readable message describing the transaction.

**success**: A boolean value stating whether the transaction was successful. If the value is False, then no changes will be made to the database.

transaction\_id: A string specifying the transaction id.

transactional\_error\_count: Number of transactional errors that occurred.

transactional\_errors: A list of transactional errors that have occurred. These errors are errors that are not specific to an individual entity. Transactional errors are of the form:

```
1 {
2     "message": string
3 }
```

updated\_entity\_count: Number of existing entities updated by the transaction.

#### **Error Types**

EntityNotFoundError A referenced entity was not found among existing entities and entities specified in the transaction.

MissingPropertyError A required property was not provided.

ValidationError A provided property did not pass a validation test.

#### Status Messages

API responses will contain a status for each entity specified in the request:

success: The desired transaction was successful and the entity's state was modified in the GDC.

valid: The desired transaction was not successful, but the trasaction was not aborted because of this entity.

error: The desired transaction was not successful, and the transaction was aborted because of this entity. This entity did not pass validation or an internal error occurred when attempting to complete the transaction. The error state will be accompanied by a list of errors recorded about the entity (see label-error-messages).

**Note:** GDC API requests are transactional. An error with processing a node specified in the transaction will abort the transaction and will result in no changes being applied for any node involved in the transaction.

# Chapter 12

# Release Notes

#### API Release Notes

#### v1.10.0

• GDC Product: Application Programming Interface (API)

• Release Date: August 22, 2017

#### **New Features and Changes**

- Longitudinal clinical data can now be submitted to the GDC
- Created new entities and reorganized the location of many properties in the GDC Dictionary. A list of deprecated properties and their new locations can be found here. Note that the deprecated properties still contain all information that they previously did. In a later release we will map the data from the old location to the new. Eventually, we will suspend submission to the old properties and will remove them entirely from the GDC.
- GDC Data Dictionary Changes Details
  - Created follow\_up entity to support longitudinal clinical data
  - Deprecated clinical test entity
  - Modified acceptable values for Read Group properties
  - Modified Diagnosis entity
  - Modified Treatment entity
  - Modified Demographic entity
  - Modified Case entity
  - Added new tumor code, tumor id, and sample types to Sample entity to support OCG
  - Added property days\_to\_diagnosis to Diagnosis entity
  - Created Somatic Mutation Index entity
  - Updated CaDSR CDE links in data dictionary
  - Added new sample type tumor to sample entity
  - Made classification\_of\_tumor on diagnosis entity non-required
  - Added support for FM-AD to Genomic Profile Harmonization Workflow entity
  - Added data type Gene Level Copy Number Scores to Copy Number Segment entity

#### **Known Issues and Workarounds**

 Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".  Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.9.0

• GDC Product: Application Programming Interface (API)

• Release Date: June 29, 2017

#### New Features and Changes

- Updated ability to search data based on genes and mutations have been released. Discussion of the new endpoints and their use can be found in the Data Portal User Guide. These feature are limited to those projects for which the GDC contains open-access MAF files.
- API request parameter from now returns first record when from=0. Previously, from=1 was the first record. from=0 is now the default.

#### **Known Issues and Workarounds**

- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.8.0

• GDC Product: Application Programming Interface (API)

• Release Date: May 9, 2017

#### New Features and Changes

• Users can now control whether a set of files will be compressed or not when downloading. For further details see the API User Guide.

#### Known Issues and Workarounds

- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.7.1

• GDC Product: Application Programming Interface (API)

• Release Date: March 16, 2017

#### New Features and Changes

- Submission: Due to Data Dictionary updates new submission templates may be required for users submitting JSON and TSV formats
- Submission: Entities in submitted state (assigned when the project has been submitted) cannot be deleted.
- Submission: When attempting to delete an entity that has child entities not specified in the request, an error message is generated that will include all of the child entities' UUIDs.
- Submission: Entities associated with files uploaded to the GDC object store cannot be deleted until the associated file has been deleted.
- Re-enable Review, Submit, and Release functions for submission
- GDC Data Dictionary Changes
- Added "submittable" property to all entities
- Changed Read Group to category biospecimen
- Added many new clinical properties available for submission
- Added sample codes from Office of Cancer Genomics (OCG) to analyte and aliquot
- Slides can now be attached to sample rather than just portion
- sample\_type\_id is no longer required when submitting sample entities
- analyte\_type\_id is no longer required when submitting aliquot and analyte entities
- Clinical Test Entity is created for storing results of a variety of potential clinical tests related to the diagnosis -
- Genomic Profiling Report entity created for storing particular derived sequencing results
- Structural Variation entity created
- Project entity includes new field "Intended Release Date"
- Project entity includes new field "Releasable"

#### **Bugs Fixed Since Last Release**

• Fixed bug where boolean properties were not accepted with TSV submission

#### Known Issues and Workarounds

- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.5.0

• GDC Product: Application Programming Interface (API)

• Release Date: October 31, 2016

#### New Features and Changes

- API responds with an error when the request specifies an unsupported combination of filters and facets.
- In TSV submissions, trailing and leading whitespace, including non-ASCII whitespace characters, are stripped from property names and values.
- For released projects, any updates to previously submitted entities (i.e. "state": "submitted") will be included in the following GDC data release.
- Performance improvements for manifest generation.

#### **Bugs Fixed Since Last Release**

 Uploading certain unsupported metadata files caused the associated submission transactions to remain stuck in pending state.

#### Known Issues and Workarounds

- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.4.0

• GDC Product: Application Programming Interface (API)

• Release Date: September 23, 2016

#### New Features and Changes

- Submission transaction log includes additional information to assist in tracking.
- Submission project state transitions are disabled temporarily while project release features are being improved.
- GDC data dictionary changes:
  - The **submittable** property was added to all entity types in the GDC data model. It indicates whether the entity type can be submitted by users.
  - Category of Read Group entities in the GDC Data Model has changed from data\_bundle to biospecimen.
  - Analyte entities support an expanded set of analyte\_type values.

#### **Bugs Fixed Since Last Release**

None to report

#### Known Issues and Workarounds

- API search & retrieval queries that do not include a **sort** parameter may return results in different order each time they are executed. This is a particular problem for paginated responses (i.e. responses to queries for which the number of results is greater than the **size** parameter).
  - Workaround: Include a sort parameter in API search & retrieval queries.
- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.3.1

- GDC Product: Application Programming Interface (API)
- Release Date: September 7, 2016

#### **New Features and Changes**

- Successful \_dry\_run submission transactions can be committed to the GDC data model without having to re-upload metadata. The transactions can also be closed to prevent them from being committed in the future.
- Submission transactions can be submitted in asynchronous mode. In this mode, the GDC API will issue an immediate acknowledgement of the transaction, along with the transaction\_id. The status of the transaction can be verified by the user at a later time by specifying the transaction\_id. Users submitting large transactions may find this mode helpful.
- New submission transaction properties can be queried with GraphQL
- GDC Data Dictionary changes:
  - Clinical Supplement entities can have data\_format set to OMF.
  - Biospecimen Supplement entities can have data\_format set to SSF or PPS.
  - Read group instrument\_model can be set to "Illumina HiSeq 4000".
  - Category of Slide entities in the GDC Data Model has changed from data\_bundle to biospecimen.

#### Bugs Fixed Since Last Release

• Incorrect BMI calculation in the import of BCR XML files.

#### Known Issues and Workarounds

- API search & retrieval queries that do not include a **sort** parameter may return results in different order each time they are executed. This is a particular problem for paginated responses (i.e. responses to queries for which the number of results is greater than the **size** parameter).
  - Workaround: Include a sort parameter in API search & retrieval queries.
- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.2.0

• GDC Product: Application Programming Interface (API)

• Release Date: August 9, 2016

#### New Features and Changes

- Tarballs generated by the data endpoint in response to multi-file data download requests now include a folder structure that puts each file in a folder whose name is the file's UUID.
- UUIDs in clinical XML files are no longer treated in a case-sensitive way by the submission endpoint.
- Improved performance of submission endpoint for transactions that include many cases.
- Speed improvements for the submission endpoint.
- BCR XML is no longer validated against its XSD at submission.

#### **Bugs Fixed Since Last Release**

- Fixed handling of POST requests to address problems with cart functionality in older versions of Firefox
- Files of category related\_files can now be downloaded from the data endpoint.
- Allowed submission by projects in certain dbGaP registration states that were previously blocked.

#### **Known Issues and Workarounds**

- API search & retrieval queries that do not include a **sort** parameter may return results in different order each time they are executed. This is a particular problem for paginated responses (i.e. responses to queries for which the number of results is greater than the **size** parameter).
  - Workaround: Include a sort parameter in API search & retrieval queries.
- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.1.0

• GDC Product: Application Programming Interface (API)

• Release Date: May 25, 2016

#### New Features and Changes

• BAM index files (.bai) are now automatically downloaded with parent BAM.

#### Bugs Fixed Since Last Release

• None to report

#### **Bugs Fixed Since Last Release**

- Sorting by file submitter\_id no longer causes an internal server error
- BAM index files are now included with harmonized BAM files
- Certain very long API requests will time out. It is recommended to break up into a series of smaller requests.

#### Known Issues and Workarounds

- Fields are not counted as missing if parent field is also missing. This may occur with queries of nested fields in the Data Portal Advanced Search or an API query using a filter. This behavior could impact results reported using search parameters of "IS MISSING" or "NOT MISSING".
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.

#### v1.0.1

• GDC Product: Application Programming Interface (API)

• Release Date: May 16, 2016

#### **New Features and Changes**

- HTTP interface that uses JSON as the primary data exchange format
- Programmatic access to functionality provided by GDC Data and Submission portals, via projects, cases, files, annotations, data, slicing, status, and submission endpoints
- Programmatic access to GDC Legacy Archive via legacy endpoint
- Token-based authentication for secure access to controlled data and to submission functionality
- RESTful search that supports simple and complex queries via filters, fields, and facets parameters, and project, files, cases, and annotations endpoints.
- Search results can be sorted using sort parameter, paginated using size and from parameters, and output in JSON, TSV, and XML using format and pretty parameters.
- \_mapping endpoint enables user discovery of fields available for data search and retrieval operations
- Support for downloading of individual files and of archives containing multiple files
- Generation of download and upload manifests for use with the GDC Data Transfer Tool
- BAM slicing functionality for downloading part(s) of a BAM file specified using chromosomal coordinates or HGNC gene names
- Transactional submission system that links individual data elements according to a graph-based GDC Data Model
- Two data entity identifiers: UUIDs, which are consistent across GDC, and Submitter IDs, for compatibility with submitters' tracking systems

#### **Bugs Fixed Since Last Release**

• None to report

#### **Known Issues and Workarounds**

- Use of non-ascii characters in token passed to Data Transfer Tool will produce incorrect error message "Internal server error: Auth service temporarily unavailable".
- Use of a decimal in an integer search field produces unexpected error.
- Certain very large API requests will time out. It is recommended to break up very large requests into a series of smaller requests.
